C;Species: Musculus (house mouse: Signature)

A;Title: Somatic mutation of immunoglobulin light-chain variable-region genes.

A;Title: Somatic musber: A01909; MuID:82002223; PMID:6791832

A;Accession: A01909

A;Molecule type: DNA

A;Rocestion: An immunoglobulin heterotetramer subunit consists of two identical light (kap aline disulfide bonds: In some cases, such as IgA and IgM, the subunits associate into la C;Superfamily: immunoglobulin V region; immunoglobulin homology

C;Keywords: heterotetramer

C;Comment: This chain was isolated from a myeloma protein that binds phosphorylcholine.
C;Comment: This chain was isolated from a myeloma protein that binds phosphorylcholine.
C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds. In some cases, such as 194 and 19M, the subunits associate into la C;Superfamily: immunoglobulin V region; immunoglobulin homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

minichromosome maintenance protein mcm7p [imported] - fission yeast (Schizosaccharomyces N;Alternate names: cell division control protein 47 homolog
C;Species: Schizosaccharomyces pombe
C;Date: 03-Dec-1999 #sequence_revision 03-Dec-1999 #text_change 28-Jul-2000
C;Accession: T39991; T45282
R;Lyne, M; Rajandream, M.A.; Barrell, B.G.; Whithead, S.; Chillingworth, T.; Churcher, Submitted to the EMBL Data Library, July 1998
A;Reference number: Z21897
A;Accession: T39991
A;Scatus: preliminary; translated from GB/EMBL/DDBJ
A;Residues: 1-760 <a href="https://docume.com/d/">LYNA</a>
A;Residues: 1-760 <a href="https://docume.com/d/"
A,Cross-references: GB:BA000007; PIDN:BAB37764.1; PID:g13363815; GSPDB:GN00154
A;Experimental source: strain O157:H7, substrain RIMD 0509952
C;Genetics:
A;Gene: EC84341
C;Superfamily: 3-oxoacyl-[acyl-carrier-protein] synthase I; 3-oxoacyl-[acyl-carrier-prot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2A10 has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW39824-26 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 12H1, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody was identified using TSA2, and has a per minute Kcat of 0.16. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;

                                                                                                                   AAW39818-20 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 6Al2, which is able to degrade cocarine. A series of cocarine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 6Al2 antibody was identified using TSAl, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 6Al2 has a per minute Kcat of 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAW39821-23 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 2A10, which is able to degrade cocaine. cution sequence temptreminators described in the sequence compression anti-CD23 (FCERII) monoclonal antibody CI1 (see also AAY3262). The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of CI1 light and heavy chain CDRs (see AAY3254-59) to render them capable of binding to the CD23 (type II molecule expressed on haematopoietic cells. The antibodies of type II molecule expressed on haematopoietic cells. The antibodies of sea used to block soluble CD23 formation for treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic colitis, crohn's disease, sjogren's syndrome, allergies, allergic asthma, intrinsic asthma, acute asthmatic exacerbation, rhintis, eczema, graft-versus-host disease, COPD, insulitis, bronchitis conditises, promothitis or diabetes), and B-cell malignancies (Claimed). They are also useful for studying interactions between CD23 and various ligands and cetermining the binding agents.
                                                                                                                                                                                    Light chain CDR L2 of mouse anti-CD23 MAb C11.
                                                                                                 AAY32255 standard; Peptide; 7 AA.

```

The patent discloses a humanised antibody or its antigen-binding CC fragment, having binding specificity for CC-chemokine receptor 2 and at least a portion of an immunoslobulin of human origin. The and at least a portion of an immunoslobulin of human origin. The chumanised antibodies are useful for inhibiting the interaction of a cell expressing CCR2. They are useful for inhibiting or treating CCC a leukocyte trafficking, for treating CCR2-mediated disorders such as inflammatory disorder, autoimmune disorders such as rheumatory disorder, autoimmune disorders such as rheumatorid or and for inhibiting restenosis. They are useful in therapy or disquence, and in the manufacture of a medicament for treating alleray, anaphylaxis, anaphylax

The present sequence represents the light chain of a catalytic antibody which is capable of degrading cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to o immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treatment of an overdose. They are also used for treatment of an overdose. They are also used for the actual section (by reducing the in vivo concentration that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Variable domain; lambda light chain; catalytic antibody; degradation; cocaine, cocaine transition state analogue; TSA; benzolc acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.

A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treatment of an overdose. They are also used for treatming addiction (by reducing the in vivo concentration that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Variable domain, lambda light chain, catalytic antibody, degradation, cocaine, cocaine transition state analogue; TSA, benzoic acid; phenyl cocaine, immunogenic conjugate, reduction; cocaine, treatment;

                                                                                                                                                                                                                                              AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 6Al2 antibody (AAW39807 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 6Al2 has a per minute Kcat of 0.072. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can

AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody (AAW39808 represents the heavy chain) was identified using TSA2, and has a per minute Kcat of 0.016. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Variable domain of the Kappa light chain of catalytic antibody 2A10.
                                                                                                                                                                                            New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

This sequence represents the light chain variable region (VL) of humanised anti-CD23 (FCERII) monoclonal antibody C11, composed of a human framework (HSIGNVII) and the light chain complementarity determining regions (see AAV3254-56) of murine antibody C11. The DNA was constructed by splice overlap FCR. The invention provides attered antibodies, wuch as chimneric or humanised antibodies, which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II molecule expressed on hamanatopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lupus erythematobus, Hashimoto's thyroiditis, multiple sclerosis, clabetes, uveitis, dermatitis, inflammatory bowel disease, ulcerative syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Sjogram's syndrome, allergies allergies asthma, intrinais asthma, acte asthmatic exacerbation, rhinitis, estema, intrinais asthma, acte asthmatic exacerbation, rhinitis, cathmia and B-cell malignancies (Claimed). They are also useful for studying interactions between CD23 and various ligands and
                                                                                                                                            Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -

                         AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. 3H-benzoic acid from 3H-phenyl cocaine. The ZAIO antibody (AAW39809 represents the heavy chain) was identified using TSAI, which is an immunogenic conjugate of a phosphate monoseter transition state analogue. Antibody ZAIO has a per minute Kcat of 0.01. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can

determining regions (CDRs) of the catalytic antibody 3B9, which is able to degrade cocaine. A series of cocaine transition state analogues to degrade cocaine. A series of cocaine transition state analogues (TSRs) were preparted and used to immunise mice for production of thybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 3B9 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the 1n vivo concentration that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents the light chain variable region (VL) of murine anti-CD23 (FCERII) monoclonal antibody Cll. The invention provides altered antibodies, such as chimerioc rhumanised antibodies (see AAY22262 and AAY32265), which comprises sufficient of the amino acid sequences of the Cll light and heavy chain complementarity determining regions (see AAY32254-99) to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble, CD23 formation in human therapy, for the treatment of arthritis, liquid servhematosus, Hashimoto's thyroiditis, multiple sclerosis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Solgren's syndrome, allergic asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, crohn's disease, Solgren's syndrome, allergic stathmatic tricularly chronic bronchitis) or diabetes (DD2) insulitis, bronchitis (particularly chronic bronchitis) or diabetes (particularly type I diabetes), and B-cell malignanches (Claimed). They are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Variable domain; lambda light chain; Catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.

                                                                                                                                                                                           AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl occaine. The 3B9 antibody (AAW39806 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can

The present sequence represents the single chain Fv region of the monoclonal catalytic antibody 3B9, which is capable of degrading cocaine. A series of cocaine transition state analogues (TSAB) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

BOUND TO THE PROTEIN.

-I - SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,
CYTOCHROME CI AND THE RIESKE PROTEIN.

-I - SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

"Phylogenetic relationships and the radiation of sigmodontine rodents
"Phylogenetic relationships and the radiation of sigmodontine rodents
in South America: evidence from cytochrome b.";
J. Mammal. Evol. 6:89-128 (1999).

-1- FUNCTION: COMPLOX TO THE UBIQUINOL-CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-CI COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS.

-1- COPACTOR: TWO HEME GROUPS (BS62 AND BS66) WHICH ARE NOT COVALENTLY
COUPLED TO ATP SYNTHESIS.
-!- COFACTOR: TWO HEME GROUPS (BS62 AND BS66) WHICH ARE NOT COVALENTLY BOUND TO THE PROTEIN.
-!- SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIBEKE PROTEIN.
-!- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

"A 460-kb DNA sequence of the Escherichia coli K-12 genome corresponding to the 40.1-50.0 min region on the linkage map.";
DNA Ree. 3:379-392(1996).

-I. FUNCTION: ESTERIFICATION, CONCOMITANT WITH TRANSPORT, OF EXOGENOUS LONG-CHAIN FATTY ACIDS INTO METABOLICALLY ACTIVE COA THIOSEFIERS
FOR SUBSEQUENT DEGRADATION OR INCORPORATION INTO PHOSPHOLIPIDS.

-I. CATALYTIC ACTIVIT: ATP + a long-chain carboxylic acid + CoA = AMP + dibhosphate + an acyl-CoA.

-I. COPACTOR: MAGNESIUM.

-I. SUBUNIT: HOMODIMER (PROBABLE).

-I. SUBUNIT: HOMODIMER (PROBABLE).

-I. SUBUNIT: BELONGS TO THE ATP-DEPENDENT AMP-BINDING ENZYME FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EcoGene; EG11530; rauw.

Elde R., Zoghbi H.Y., Orr H.T.;

A. Cloning and developmental expression analysis of the murine homolog

of the spinocerebellar ataxia type 1 gene (Scal).";

thum. Mol. Genet. 5:33-40(1996).

C. -! TISSUE SPECIFICITY: WIDELY EXPRESSED. IN BRAIN, THE PATTERN OF

DISTRIBUTION IS LIMITED TO NEURONS POPULATIONS.

C. -! DEVELOPMENTAL STAGE: TRANSIENT EXPRESSION BURST IN PURKINDE CELLS

AS THE CEREBELLAR CORTEX BECOMES FUNCTIONAL (POSTNATAL DAY 14),

AND IN MESSENCHYMAL CELLS OF THE DEVELOPING INTERVERTEBRAL DISCS OF

THE SPINAL COLUMN:

C. -! POLYMORPHISM: THE MURINE POLY-GLN REGION IS VERY LIMITED IN

C. -! POLYMORPHISM: THE HUMAN SCAI AND IS NOT POLYMORPHIC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This SWISS-PROT entry is copyright. SCAL IS AN AUTOSOMAL DOMINANT NEUGODEGENERATIVE DISORDER
CHARACTERIZED BY PROGRESSIVE NEUGONAL LOSS IN THE CEREBELLUM,
BRAIN STEM AND SPINOCEREBELLAR TRACTS. CLINICAL FEATURES ARE
CREBELLAR ATAXAL, DYSARTHRIA, OPHTALMOPARESIS, MUSCLE WASTING AND
NEUROPATHY. ONSET OF THE DISEASE USUALLY OCCURS IN THE THIRD OR
POURTH DECADE OF LIFE AND DEATH OCCURS IN THE THIRD OR

T. Site-directed mutagenesis of cysteine residues in biliverdin
"Site-directed mutagenesis of cysteine residues in biliverdin
reductase. Roles in substrate and cofactor binding.";

Eur. J. Biochem. 222.597-603(1994).

-!- FUNCTION: CONVERTS BILIVERDIN TO BILIRUBIN, DISPLAYS TWO DISTINCT
PH OPTIMA USING A DIFFRENT COPACTOR AT EACH PH: NADH AT THE LOWER
PH 6.7-6.9 RANGE AND NADH AT PH 8.5-8.7. NADPH, HOWEVER, IS THE
PROBABLE COPACTOR IN BIOLOGICAL SYSTEMS.

-!- CATALYTIC ACTIVITY: Bilirubin + NAD(P) (+) = biliverdin + NAD(P) H.

-!- PATHWAY: FIRAL STRP IN HEME METABOLISM.

-!- SUBUNIT: MONOMER (BY SIMILARITY).

-!- SUBUNIT: MONOMER (BY SIMILARITY).

-!- SUBUNITY: TO E.COLI YHHX.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Smith M.F., Patton J.L.;

In Phylogenetic relationships and the radiation of sigmodontine rodents in South America: Bvidence from cytochrome b.";

J. Mammal. Evol. 6:89-128(1999).

-!- FUNCTION: COMPLEX III OR CYTOCHROME B.-CI COMPLEX), WHICH IS A RESPIRATORY CHAIN THAT GENERALES AN ELECTROCHEMICAL POTENTIAL.

C. COUPLED TO ATP SYNTHESTS (BY SIMILARITY).

-!- COPACTOR: TWO HEME GROUPS (BSCS AND BSCS), WHICH ARE NOT COVALENTLY. BOUND TO THE PROTEIN (BY SIMILARITY).

-!- SUBBINIT: THE MAIN SUBBNITS OF COMPLEX B.-CI ARE: CYTOCHROME B.

C. CYTOCHROME CI AND THE RISKE PROTEIN (BY SIMILARITY).

-!- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

```
A molecular phylogeny of ground squirrels and prairie dogs.";

"A molecular phylogeny of ground squirrels and prairie dogs.";

Submitted (JUN-1999) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: COMPONENT OF THE UBIOUTNOL.—CYTOCHROWE C REDUCTASE

COMPLEX (COMPLEX III OR CYTOCHROME B-CI COMPLEX), WHICH IS A
RESEPRATORY CALAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL

COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

-!- COPACTOR: TWO HEME GROUPS (BS62 AND BS66) WHICH ARE NOT COVALENTLY

BOUND TO THE PROTEIN (BY SIMILARITY).

-!- SUBMIT: THE MAIN SUBMITS OF COMPLEX B-CI ARE: CYTOCHROME B,

CYTOCHROME CI AND THE RIESKE PROTEIN (BY SIMILARITY).

-!- SIMILARITY: BELEVORG TO THE CYTOCHROME B FAMILY.

EMBL: AF157946; AAD50230.1; --
